SUMMARY

Computer Science graduate student specializing in Machine Learning and AI, with hands-on experience developing algorithmic trading systems, transformer-based models, and full-stack applications. Adept at building end-to-end data pipelines and applying deep learning techniques to real-world problems. Seeking roles at the intersection of AI research and applied engineering, with a track record of turning complex data into actionable systems.

EDUCATION

Stevens Institute of Technology – Hoboken, NJ
M.S. in Computer Science (Expected May 2026)
Graduate Certificate in Machine Learning & Databases

Xavier Institute of Engineering – Mumbai, India
B.E. in Computer Engineering | CGPA: 8.67

PROJECTS

LLM-Inspired Market Sequence Modeling | *Python, PyTorch, Transformers* Ongoing

- Designing a representation of financial candlestick data as **discrete token sequences** for transformer-based next-step prediction
- Building **preprocessing pipelines** to convert raw OHLCV time-series data into structured token vocabularies encoding price movement and volatility
- Training **autoregressive transformer models** to predict the next market state from historical candle sequences
- Evaluating performance against traditional time-series baselines to assess sequence-model effectiveness

Bankruptcy Prediction Using Ensemble Modeling | *Python, Scikit-learn*

- Led **feature engineering and dimensionality reduction** (95 → 36 features) using correlation filtering and VIF analysis
- Clustered firms using **Gaussian Mixture Models** to enable subgroup-specific modeling
- Trained multiple classifiers (SVM, Random Forest, Gradient Boosting) and combined them via a **stacked ensemble**
- Improved prediction accuracy from **62% to 70%** through subgroup modeling and ensembling

NYC Street Art Map – Full Stack Web Application | *JavaScript, MongoDB*

- Built an **interactive platform** for discovering and contributing NYC street art locations
- Developed a **geospatial interface** using Leaflet.js with user-submitted artwork pins
- Implemented authentication, submission workflows, and **admin moderation features**
- Designed backend storage using **MongoDB** for geotagged user-generated content

EXPERIENCE

Millicent Technologies – Mumbai, India
Software & Quantitative Developer Intern

- Developed **rule-based trading strategies** using technical indicators and price-action signals, backtested on historical datasets to evaluate risk-adjusted performance and robustness
- Built **custom indicators and screeners** in Pine Script for real-time and historical market analysis
- Designed and implemented a **modular algorithmic trading engine** in Python for live market execution
- Built **data pipelines** to ingest, clean, and process real-time candlestick data for strategy evaluation
- Integrated **automated trade signal generation** and order execution logic for seamless live trading
- Optimized system performance to handle **real-time data streams** and reduce execution latency

TECHNICAL SKILLS

Languages: Python, JavaScript, Java, C, Pine Script
Machine Learning / AI: Scikit-learn, TensorFlow, PyTorch, NLP, Deep Learning, Transformer/LLM applications
Data & Databases: SQL, MongoDB, Data Preprocessing, Feature Engineering
Tools & Platforms: Git, GitHub, Jupyter Notebook, VS Code, Power BI
